

ABT Engine Control (AEC)

HIGH QUALITY HARDWARE

- ABT Engine Control Unit (AEC) working alongside factory ECU.
- Non-destructive installation (wiring harness and stainless-steel support brackets).

ACTIVE ENGINE PROTECTION

- Performance increase only released in vehicle specific optimum range of engine temperature, air temperature, height above sea level.
- Best possible engine protection through continuous monitoring of speed and load via several sensors (3D mapping).

QUALITY AT MANUFACTURER LEVEL

- Developed on 93 octane fuel.
- Extensively tested on dynamometer and under real conditions on roads.
- German DOT (TÜV) approved.
- Specifically developed for the respective engines.
- Based on several decades of motorsports experience (Audi Factory Race Team in Formula E and DTM Championship) and performance tuning for street cars.
- No increase in CO² emissions in relation to 858/2018/EU or 2007/ 46/EC and their associated standards.
- Due to the increased torque, it is possible to drive in a higher gear. The increase in performance thus might reduce the fuel consumption under normal use.
